

noise-injection oracle  
(points, mean of sev 2 to 5)

- cleared by a training-free operator (Holm, 432 tests)
- cleared by a learned restorer
- not cleared: nothing beats the noise-injection oracle
- significant, but not after the 432-test correction

Decolorization and Gaussian blur: operators do gain, but noise gains as much.

Codec error and Shadow: the noise bar is low, yet no operator clears it after the correction.
